Azure Logic Apps:

Azure Logic Apps is a **cloud-based workflow automation and integration platform** provided by Microsoft Azure. It allows you to **create, run, and manage automated workflows** that connect apps, data, services, and systems—**with little or no code.**

microsoft

Think of it as a visual tool where you can automate business processes like:

- Sending notifications
- Processing orders
- Moving or transforming data
- Integrating cloud and on-premises systems

microsoft +1

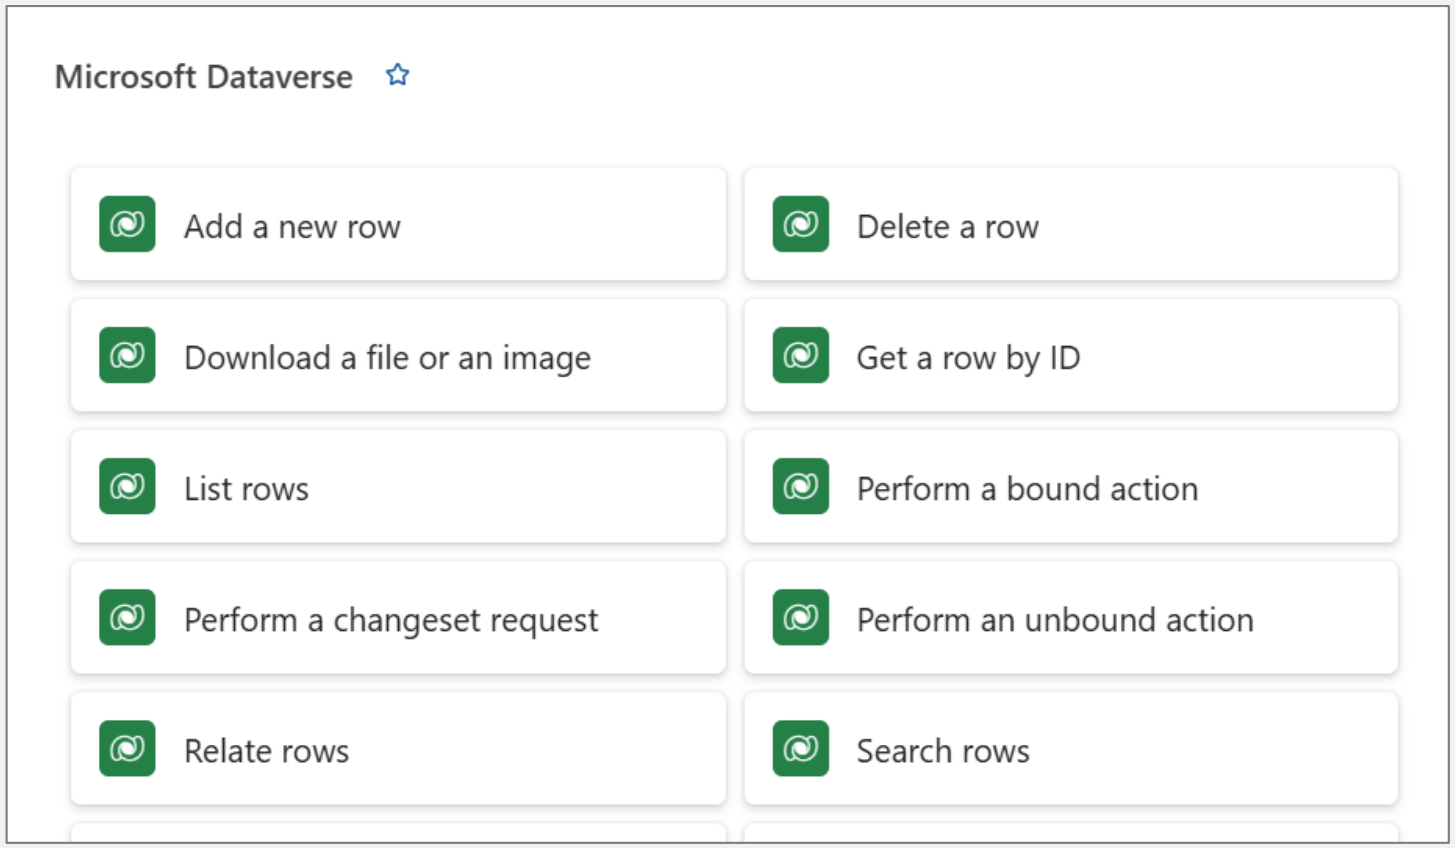

Basics

Every workflow includes a trigger, which defines the calls that instantiate and start the workflow. Here are the general trigger categories:

- A *polling* trigger, which checks a service's endpoint at regular intervals
- A *push* trigger, which creates a subscription to an endpoint and provides a *callback URL* so the endpoint can notify the trigger when the specified event happens or data is available. The trigger then waits for the endpoint's response before firing.

- ❑ Trigger
- ❑ Actions
- ❑ Built-in tools

Basics

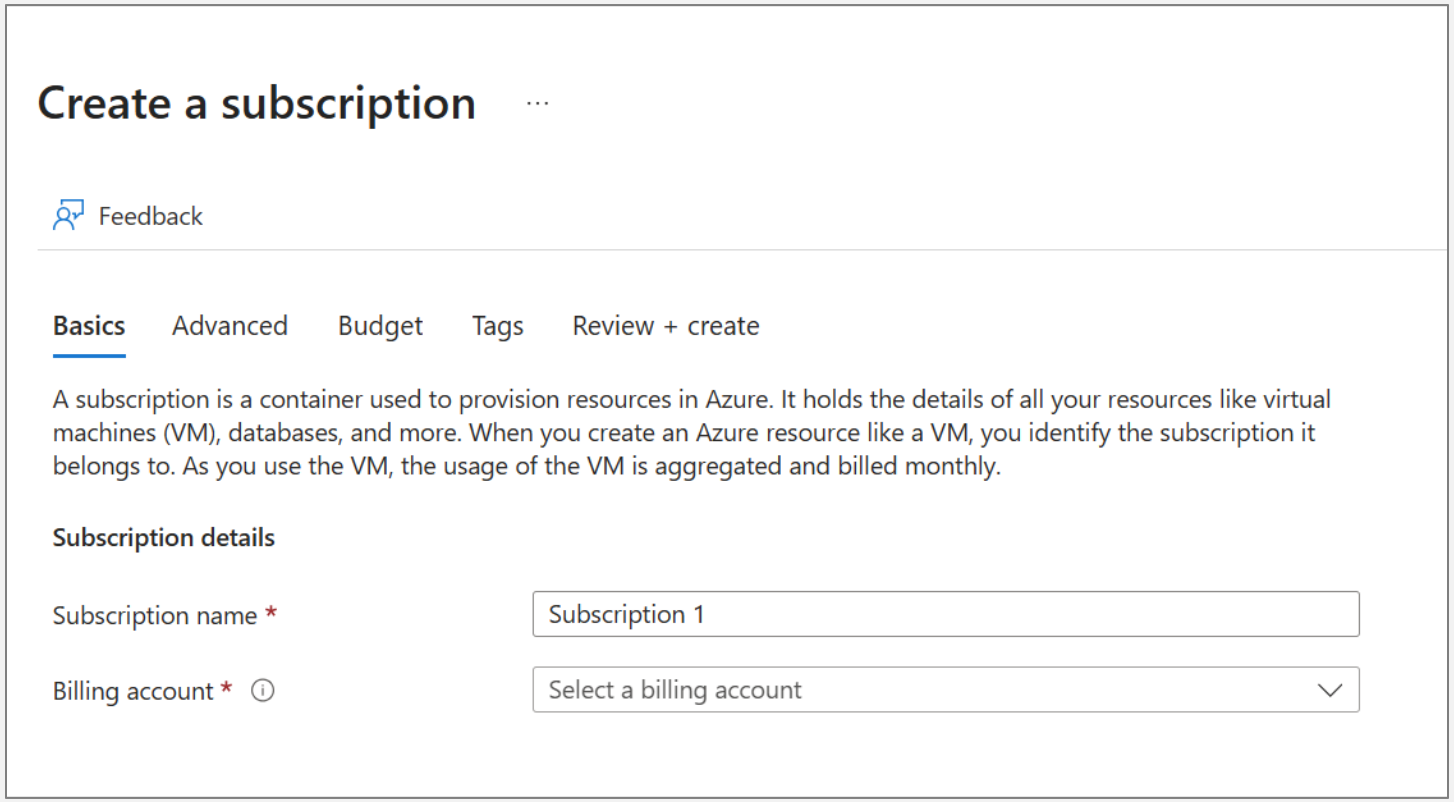

- ❑ Trigger
- ❑ Actions
- ❑ Built-in tools

Basics

Action type	Description
Compose	Creates a single output from inputs, which can have various types.
Execute JavaScript Code	Run JavaScript code snippets that fit within specific criteria. For code requirements and more information, see Add and run code snippets with inline code.
Function	Calls an Azure Function.
HTTP	Calls an HTTP endpoint.
Join	Creates a string from all the items in an array and separates those items with a specified delimiter character.
Parse JSON	Creates user-friendly tokens from properties in JSON content. You can then reference those properties by including the tokens in your logic app.

            "inputs": {
                "host": {
                    "connection": {
                        "name": "@parameters('$connections')['sharepointonline-1']['connectionId']"
                    }
                },
                "method": "post",
                "path": "/datasets/@{encodeURIComponent(encodeURIComponent(parameters('SitePath')))}/
                "queries": {
                    "source": "@variables('pathSource')",
                    "destination": "@variables('pathTarget')",
                    "overwrite": false,
                    "queryParametersSingleEncoded": true
                }
            }
        },
```

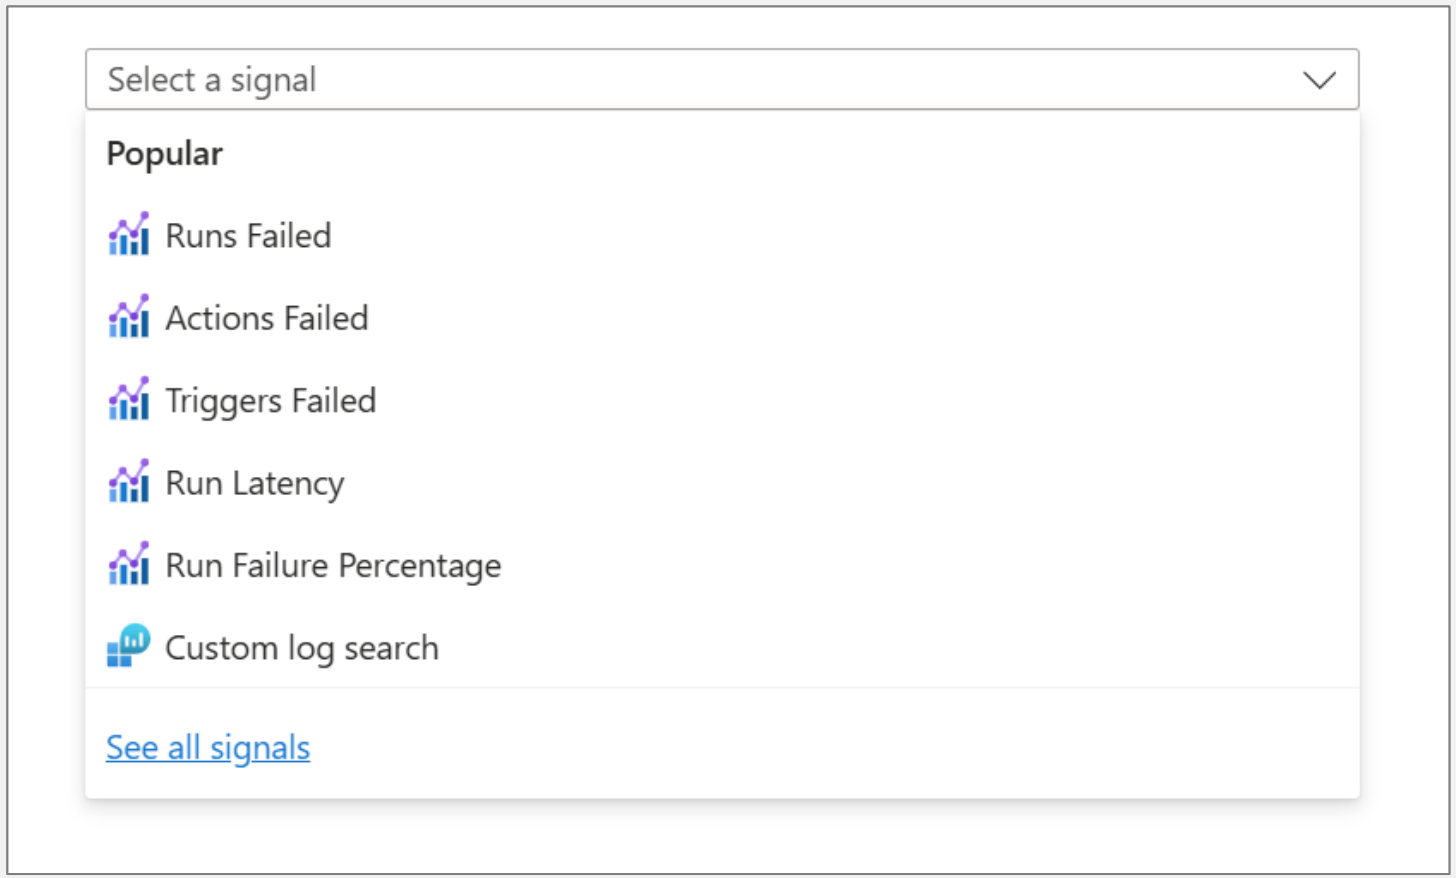

- ❑ Parameters
- ❑ Code view
- ❑ Run history

IT Pros

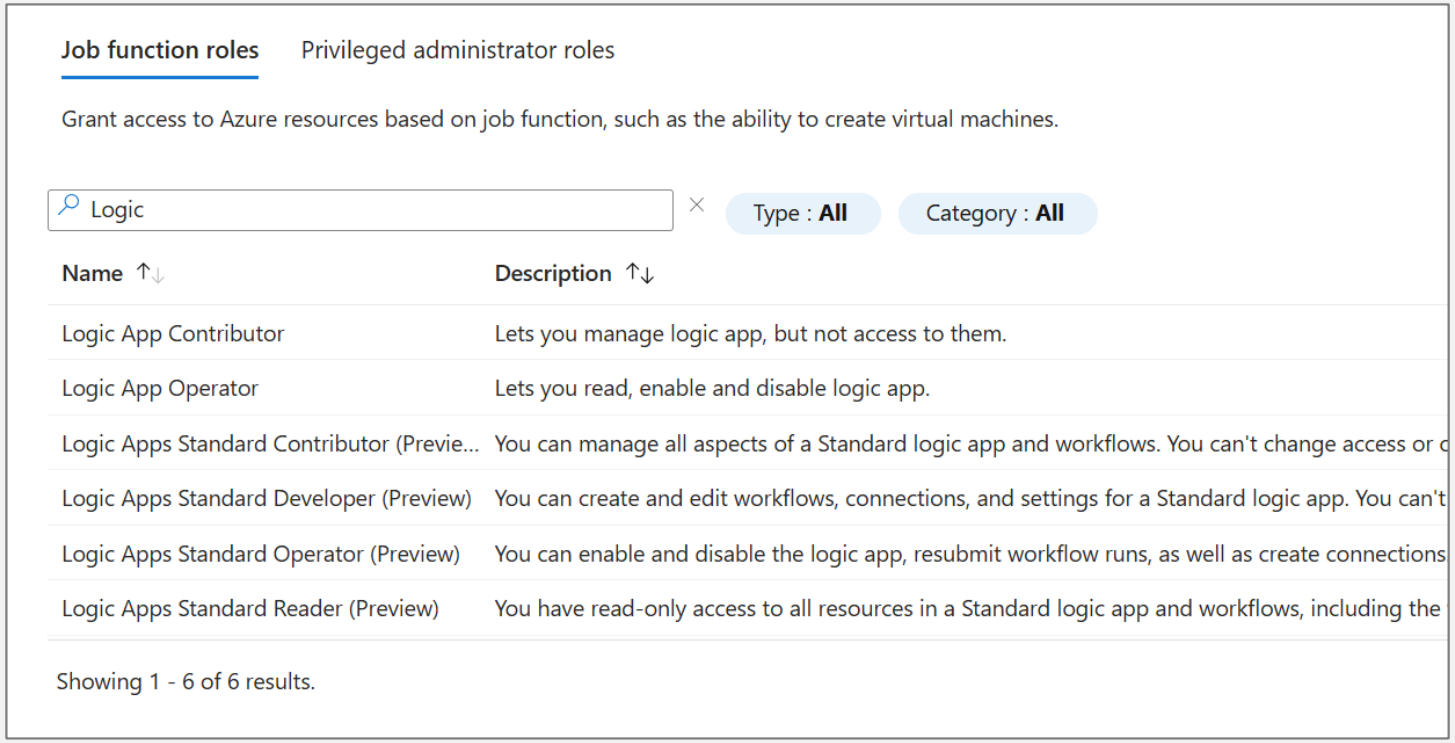

- ❑ Parameters
- ❑ Code view
- ❑ Run history

Azure Admins

- ❑ Alerts
- ❑ Role assignments
- ❑ Application lifecycle management

Azure Admins

- ❑ Alerts
- ❑ Role assignments
- ❑ Application lifecycle management

Azure Admins

Create pipelines in Azure DevOps

To create the infrastructure along with the CI and CD pipelines in Azure DevOps, repeat the following steps for each of the following pipeline files:

- **infrastructure-pipeline.yml** for the Infrastructure-as-Code pipeline.
- **CI-pipeline.yml** for the Continuous Integration pipeline.
- **CD-pipeline.yml** for the Continuous Delivery pipeline.

- ❑ Alerts
- ❑ Role assignments
- ❑ Application lifecycle management

Demo + Considerations

- ❑ Complexity
  - How many total actions?
  - How many total connectors?
- ❑ Compacity
  - How many hourly runs?
  - How many daily runs?
- ❑ Responsibility
  - Who pays the bill?
  - Who maintains the flow?

Azure Logic Apps: Automation for the Enterprise

Well-designed Power Automate flows can easily scale for large teams, but are they scalable enough for the entire org? Can your cloud flows reliably support larger, mission-critical, enterprise-level workloads? Possibly, but maybe not.

Azure Logic Apps, Microsoft's enterprise orchestration platform, is the assured choice if you're integrating across software ecosystems and requiring greater throughput.

In this session, we'll discuss Azure Logic Apps' relationship with Power Automate, its flexible development options, opportunities for CI/CD deployment, and day-one savings.
